8. Conclusion

1. Introduction

In today's organizations, laptops are essential tools that enable employees to perform their daily tasks efficiently. Employees frequently require new laptops due to onboarding, hardware upgrades, device replacements, or changing job responsibilities. Managing these laptop requests manually through emails, phone calls, or paper-based processes often requires significant administrative effort and can lead to delays, communication gaps, inconsistent approvals, and difficulties in tracking request progress.

As organizations continue to grow, the number of laptop requests increases, making manual request management inefficient and time-consuming. This can result in slower request processing, reduced visibility into request status, inconsistent approval procedures, and challenges in meeting organizational service expectations.

The **Laptop Request Process**, developed using the **ServiceNow** platform, provides a centralized and automated solution for managing employee laptop requests. Users can easily submit a laptop request through the **Service Catalog** by selecting the required laptop type and providing a business justification. Once the request is submitted, **Flow Designer** automatically initiates the workflow, routes the request for approval, creates a Catalog Task for the IT support team upon approval, waits until the task is completed, and finally sends an email notification informing the requester that the laptop has been successfully provided.

The proposed system offers the following benefits:

- Faster processing of laptop requests.
- Standardized and automated request workflow.
- Reduced manual intervention and administrative workload.
- Automated approval and task assignment.
- Improved transparency and real-time request tracking.
- Better communication through automated email notifications.
- Enhanced efficiency in IT service delivery.
- Improved user satisfaction through a streamlined request process.

By utilizing the low-code capabilities of **ServiceNow**, this project demonstrates how **IT Service Management (ITSM)** can automate the complete laptop request lifecycle. The solution improves operational efficiency, ensures consistent request processing, minimizes manual effort, and provides a scalable framework that can be extended to support additional IT asset and service requests in the future.

1.1 Project Overview

The **Laptop Request Process** is an automated ServiceNow application developed to simplify and streamline the process of requesting laptops for employees within an organization. In many organizations, employees require laptops to perform their official duties. Traditionally, these requests are handled through emails or manual paperwork, making the process time-consuming, difficult to track, and prone to delays.

This project automates the entire laptop request lifecycle using **ServiceNow Service Catalog** and **Flow Designer**. Employees can submit a laptop request through the Service Portal by selecting the required laptop type and providing a business justification. Once the request is submitted, the system automatically initiates a workflow that sends the request for approval to the designated approver.

If the request is approved, the workflow automatically creates a **Catalog Task** for the IT support team to prepare and provide the requested laptop. The system then waits until the IT team completes the task. After the task is marked as completed, the workflow automatically sends an email notification to the employee confirming that the laptop request has been successfully fulfilled.

By automating approvals, task creation, request tracking, and notifications, the system minimizes manual intervention, reduces processing time, improves transparency, and ensures that every laptop request follows a standardized process. The project demonstrates how ServiceNow can be used to automate business workflows, improve operational efficiency, and enhance the overall user experience.

1.2 Problem Statement

In many organizations, laptop requests are managed through manual methods such as emails or paper-based processes. These approaches often lead to delays in approvals, increased administrative effort, difficulty in tracking request status, and inconsistent request handling. As the number of employees grows, managing laptop requests manually becomes inefficient and time-consuming, affecting the overall productivity of the IT support process.

1.3 Proposed Solution

The proposed solution is to develop an automated **Laptop Request Process** using the ServiceNow platform. The system enables employees to submit laptop requests through the Service Catalog, where the request is automatically processed using Flow Designer. The workflow routes the request for approval, creates a Catalog Task for the IT team after approval, waits for task completion, and sends an email notification to the requester once the process is completed. This automation improves request

management, enhances transparency, and ensures a consistent workflow throughout the laptop request lifecycle.

2. Project Objectives

The main objective of this project is to develop an automated **Laptop Request Process** using the ServiceNow platform that reduces manual effort and improves the efficiency of handling employee laptop requests. The system provides users with a simple and centralized platform for submitting laptop requests while automating the processes of approval, task creation, email notifications, and request tracking.

The project also focuses on building a standardized workflow that improves service quality, increases operational efficiency, and ensures timely laptop request fulfillment with minimal human intervention.

The specific objectives of this project are:

- Develop a centralized **Service Catalog** for submitting laptop requests.
- Design an interactive request form using **Catalog Variables** to capture the required information.
- Configure **Flow Designer** to automate the complete laptop request workflow.
- Establish an automated approval process before laptop allocation.
- Automatically create a **Catalog Task** for the IT support team after approval.
- Monitor task completion using **Wait for Condition** in the workflow.
- Generate automatic email notifications upon successful completion of the request.
- Improve transparency by enabling users to track the status of their requests.
- Reduce manual effort and processing time through workflow automation.
- Build a scalable solution that can be extended to support additional IT asset requests in the future.

3. Key Features

The proposed Laptop Request Process includes the following major features:

- User-friendly **Service Catalog** for submitting laptop requests.
- Interactive request form using **Catalog Variables**.
- Automated workflow using **Flow Designer**.
- Approval process for validating laptop requests.
- Automatic creation of **Catalog Tasks** for the IT support team.
- **Wait for Condition** to monitor task completion.
- Automatic email notifications upon request completion.
- Real-time request status tracking.
- Standardized and consistent request processing.
- Reduced manual effort and faster request fulfillment.
- Improved transparency throughout the request lifecycle.
- Scalable workflow that can be extended for other IT asset requests.

4. Project Milestones

The project implementation follows five major milestones.

Milestone 1: Service Catalog Creation

Objective

Establish a centralized Service Catalog that enables employees to submit laptop requests through a user-friendly interface.

Activities

- Create the **Laptop Request** catalog item.
- Configure the catalog under the appropriate category.
- Provide a meaningful name and short description.
- Design the request form for laptop requests.
- Organize the catalog item according to ITSM best practices.
- Ensure the catalog item is available through the Service Portal.

Milestone 2: Catalog Variables Configuration

Objective

Design an interactive request form to collect all the necessary information required for processing laptop requests.

Activities

- Create Catalog Variables for the Laptop Request catalog item.
- Configure variables such as Laptop Type and Business Justification.
- Set mandatory fields where required.
- Arrange variables in a logical order for better user experience.
- Validate user input to ensure accurate request submission.
- Verify that all required information is captured before the request is submitted.

Milestone 3: Flow Designer Implementation

Objective

Develop an automated workflow using Flow Designer to manage the complete laptop request process from submission to completion.

Activities

- Create a new flow for the Laptop Request catalog item.
- Configure the Catalog Item Requested trigger.
- Implement the Ask for Approval action.
- Add an If condition to process approval decisions.
- Automatically create a Catalog Task for the IT support team.
- Configure Wait for Condition to monitor task completion.
- Send an automatic email notification after the request is completed.
- Test the complete workflow to ensure successful execution.

Milestone 4: Testing

Objective

Verify that the Laptop Request Process functions correctly and that each stage of the workflow operates as expected.

Activities:

- Test the Service Catalog item.
- Verify catalog variable functionality.
- Test the Flow Designer workflow.
- Validate the approval process.
- Verify automatic Catalog Task creation.
- Test the Wait for Condition action.
- Verify email notification delivery.
- Perform end-to-end testing of the complete laptop request process.
- Conduct User Acceptance Testing (UAT).

Milestone 5: Deployment

Objective

Deploy the Laptop Request Process and ensure that it is ready for use by employees within the organization.

Activities:

- Validate all ServiceNow configurations.
- Publish the **Laptop Request** catalog item.
- Activate the Flow Designer workflow.
- Verify the approval process and Catalog Task creation.
- Monitor flow executions and email notifications.
- Perform final system validation.
- Train users on submitting laptop requests.
- Monitor the application after deployment to ensure smooth operation.

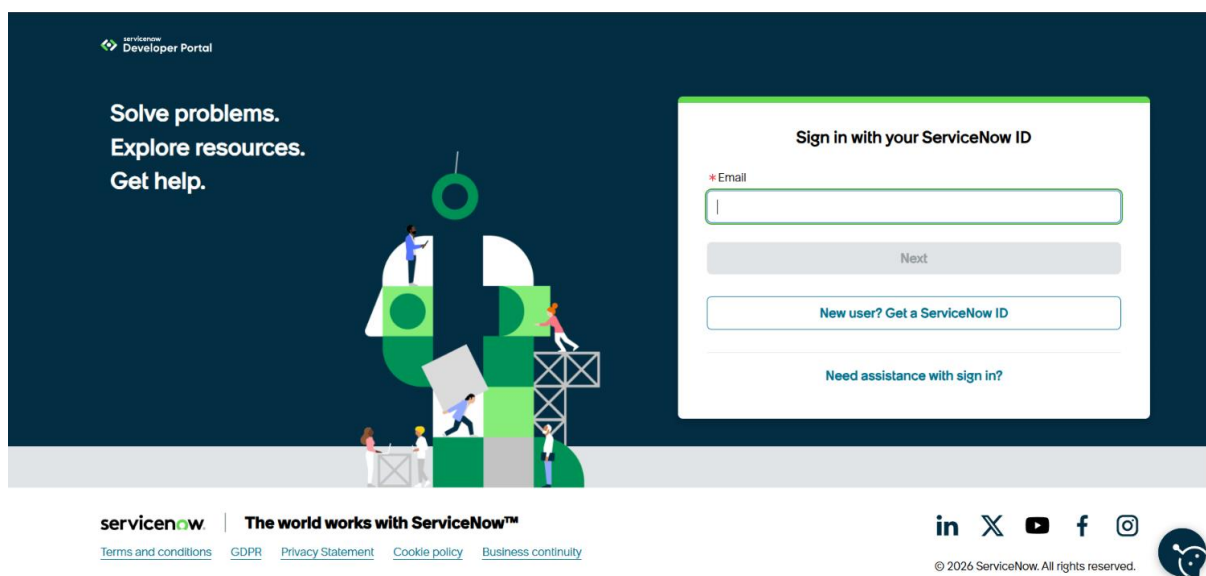

5. ServiceNow Developer Setup

Before developing the application, a ServiceNow Personal Developer Instance (PDI) must be created. The PDI provides a fully functional ServiceNow environment where applications can be developed, tested, and deployed without affecting production systems.

5.1 Creating a ServiceNow Developer Account

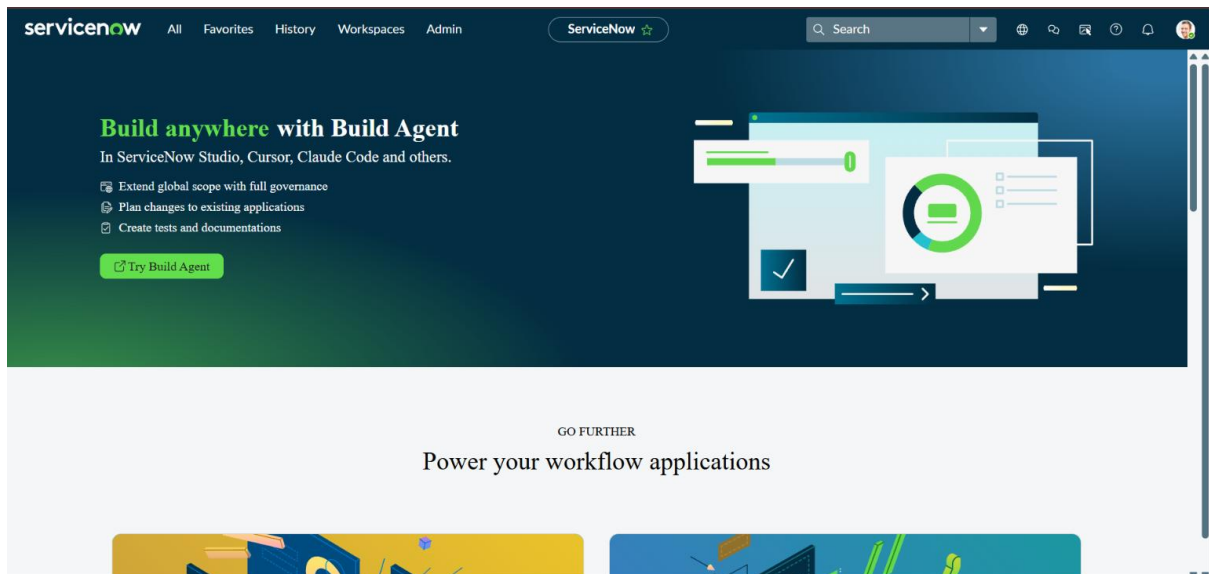

To begin development, perform the following steps:

1. Visit the ServiceNow Developer Portal.
2. Click **Sign Up** to create a free developer account.
3. Enter the required information:
 - First Name
 - Last Name
 - Email Address
 - Password
4. Verify the email address using the activation link sent to your registered email.
5. Log in to the ServiceNow Developer Portal.
6. Click **Start Building**.
7. Request a **Personal Developer Instance (PDI)**.
8. Wait for the instance to be provisioned.
9. Launch the instance and log in using the generated credentials.

5.2 Accessing the Personal Developer Instance (PDI)

1. Log in to the **ServiceNow Developer Portal** using your registered account.
2. Navigate to the **Instances** section.
3. Request a new Personal Developer Instance if one has not already been created.
4. Wait for the instance to be provisioned.
5. Click **Open Instance** to launch the PDI.
6. Log in using the instance URL and the provided administrator credentials.
7. After successful login, the ServiceNow platform is ready for application development and testing.

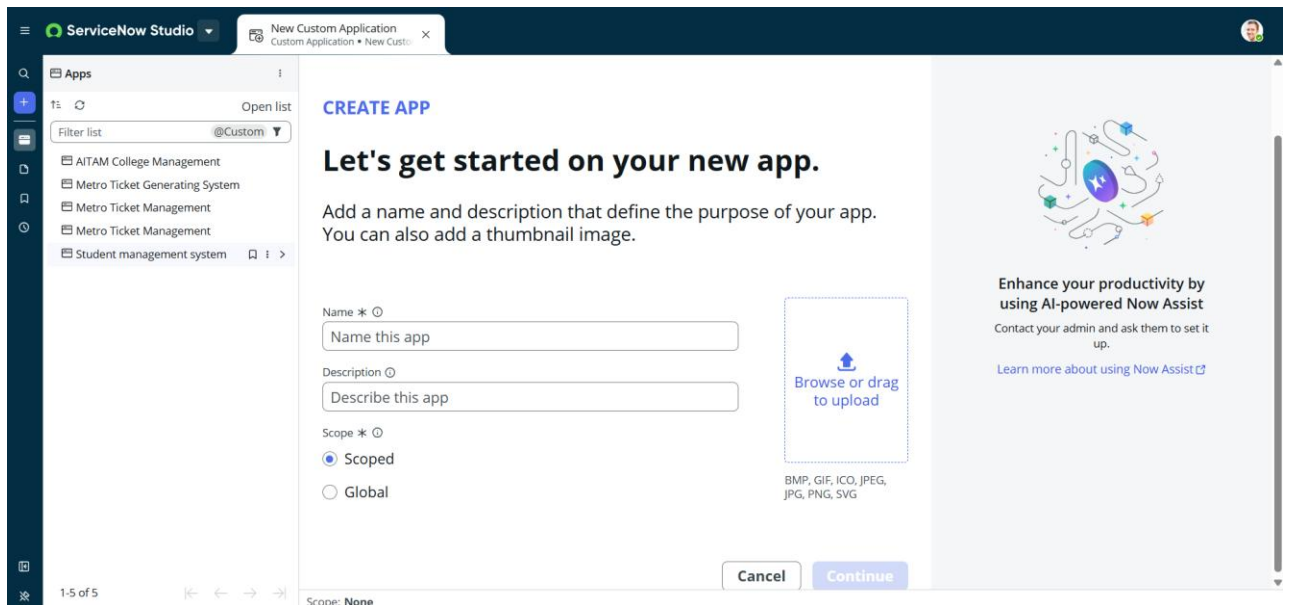

5.3 Accessing ServiceNow Studio

ServiceNow Studio is an integrated development environment that enables developers to create, manage, and customize applications within the ServiceNow platform. It provides a centralized workspace for developing application components such as Service Catalog items, Flow Designer workflows, scripts, and other application resources.

Steps to Access ServiceNow Studio

1. Log in to your ServiceNow Personal Developer Instance (PDI).
2. Open the Application Navigator.
3. Search for Studio.
4. Click ServiceNow Studio to launch the development environment.
5. Select the required application or create a new application.
6. Create and configure application components such as the Laptop Request catalog item, catalog variables, and Flow Designer workflow.
7. Save, test, and publish the application after completing the development process.

6. Project Implementation in ServiceNow

6.1 Service Catalog Creation

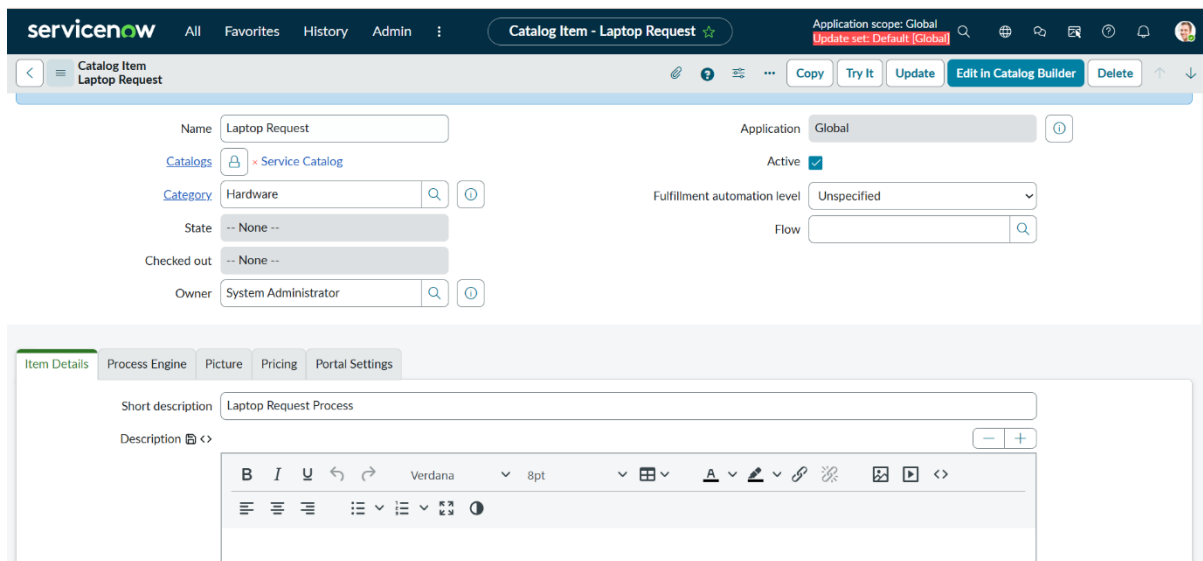

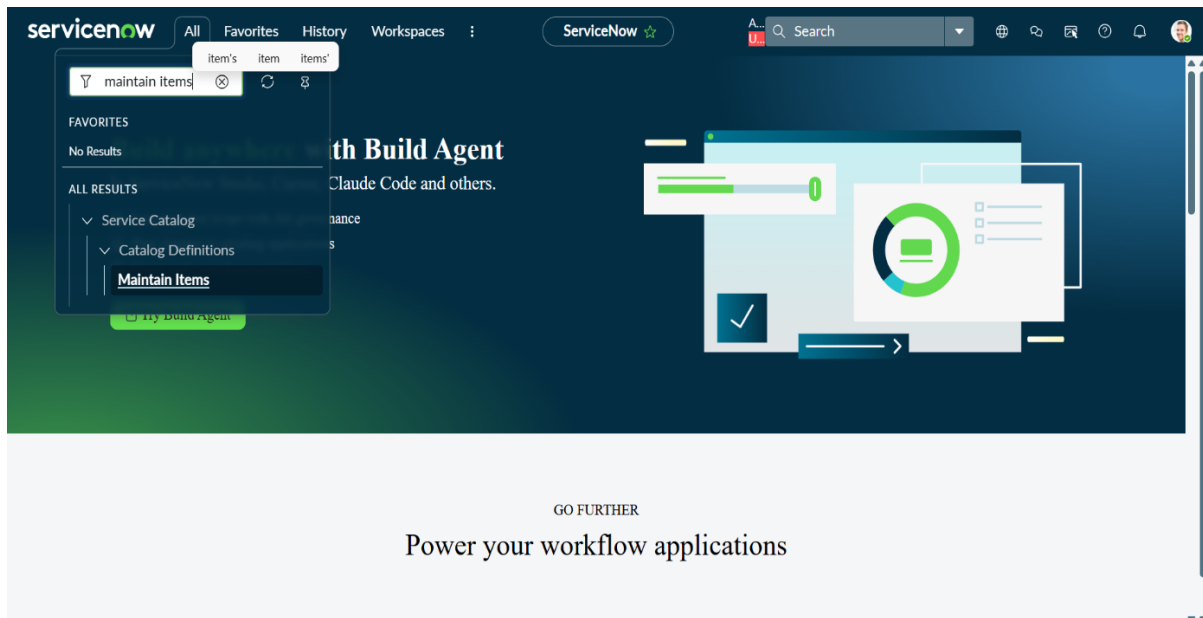

The Service Catalog provides a centralized self-service portal where employees can easily submit laptop requests. In this project, a catalog item named **Laptop Request** was created to allow users to request a laptop by selecting the required laptop type and providing the necessary business justification.

Steps to Create the Service Catalog Item

1. Open the **Application Navigator** in the ServiceNow platform.
2. Search for **Service Catalog**.
3. Navigate to the following path:

Service Catalog → Catalog Definitions → Maintain Items

4. Click the **New** button to create a new catalog item.
5. Enter the required details:
 - **Catalog Item Name:** Laptop Request
 - **Catalog:** Service Catalog
 - **Category:** Hardware
 - **Short Description:** Laptop Request Process
6. Click **Save** to create and store the catalog item successfully.

Purpose of the Catalog

The Service Catalog serves as the primary interface through which employees can submit laptop requests. It provides a centralized and user-friendly platform that standardizes the laptop request process across the organization.

Using the Laptop Request catalog item, users can:

- Request a new laptop.
- Select the required laptop type.
- Provide a business justification for the request.
- Submit the request for approval.
- Track the request throughout its lifecycle.

By providing a single point of access for laptop requests, the Service Catalog eliminates the need for manual email or paper-based requests, ensuring consistency, better tracking, and an efficient request management process.

6.2 Catalog Variables Configuration

Catalog Variables are used to collect the required information from employees when they submit a laptop request. These variables appear as input fields on the Service Catalog form and capture the details needed to process the request.

The information entered through these variables is later used by Flow Designer, the approval process, Catalog Tasks, and email notifications to automate the complete laptop request workflow.

Steps to Create Catalog Variables

Follow the steps below to configure catalog variables:

1. Open the Laptop Request catalog item.
2. Navigate to the Variables related list.
3. Click the New button to create a new variable.
4. Configure the required properties, including:
 - Variable Type
 - Question
 - Name
 - Order
5. Click Save to create the variable.
6. Repeat the above steps until all required catalog variables have been added to the Laptop Request catalog item.

The screenshot shows the ServiceNow interface for creating a new catalog variable. The top navigation bar includes 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', and a 'Variable - New Record' button. Below the navigation bar, the form is titled 'Variable - New record'. The 'Type' dropdown is set to 'Select Box'. The 'Catalog item' field is set to 'Laptop Request'. The 'Order' field is set to '100'. There are checkboxes for 'Mandatory', 'Read only', 'Hidden', and 'Disable automatic slot fill based on user context'. Below these are tabs for 'Question', 'Annotation', 'Type Specifications', 'Default Value', 'Auto-populate', 'Permission', and 'Availability'. The 'Question' tab is active, showing a text area for the question, and fields for 'Question' (Laptop Type), 'Name' (laptop_type), 'Conversational label', and 'Tooltip'. A 'Submit' button is at the bottom left.

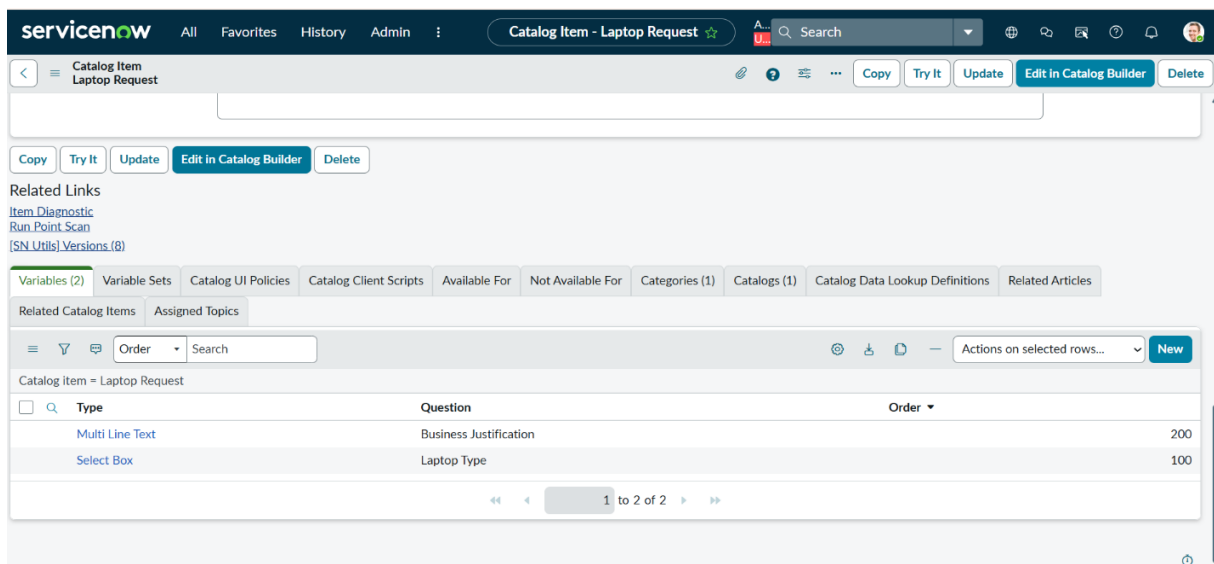

Variable Configuration

The **Laptop Request** catalog item consists of two variables that collect the necessary information required to process a laptop request. These variables ensure that the IT team receives the required details for approval and fulfillment.

Variable Name Variable Type

Laptop Type Select Box

Business Justification Multi Line Text

Types of Variables Used

1. Select Box

A Select Box variable allows users to choose one option from a predefined list of values.

Example:

Laptop Type

The available options include:

- Dell
- HP
- Lenovo
- MacBook

Purpose:

This variable enables employees to select the type of laptop they require, ensuring that the IT support team can process the request accurately.

The screenshot shows the ServiceNow interface for configuring a variable named 'Laptop Type'. The top navigation bar includes 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', and a search bar. The variable configuration form includes fields for 'Question' (Laptop Type), 'Name' (laptop_type), 'Conversational label', and 'Tooltip'. Below the form are 'Copy', 'Update', and 'Delete' buttons. A 'Related Links' section contains links for 'Run Point Scan' and '[SN Utils] Versions (1)'. At the bottom, there is a table titled 'Question Choices' for 'Laptop Type'.

Text	Value	Order	Inactive
Dell	Dell	100	false
HP	HP	200	false
Lenovo	Lenovo	300	false
MacBook	MacBook	400	false

2. Multi-Line Text

A Multi-Line Text variable is used to capture detailed information entered by the user.

Example:

Business Justification

Purpose: This variable allows employees to provide the reason for requesting a laptop. The information helps the approver review and evaluate the request before approval.

The screenshot shows the ServiceNow interface for configuring a variable named 'New Record'. The top navigation bar includes 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', and a search bar. The variable configuration form includes fields for 'Application' (Global), 'Type' (Multi Line Text), 'Catalog item' (Laptop Request), and 'Order' (200). There are also checkboxes for 'Active', 'Mandatory', 'Read only', 'Hidden', and 'Disable automatic slot fill based on user context'. Below the form are tabs for 'Question', 'Annotation', 'Type Specifications', 'Default Value', 'Auto-populate', 'Permission', and 'Availability'. The 'Question' tab is selected, showing a form for 'Business Justification' with fields for 'Question', 'Name', 'Conversational label', 'Tooltip', and 'Example Text'.

Advantages of Catalog Variables

The use of Catalog Variables provides several benefits, including:

- Standardized collection of laptop request information.
- Improved accuracy of the submitted request details.
- Simplified approval and workflow automation.

- Reduced manual data entry and processing.
- Better tracking and management of laptop requests.
- Consistent information for the IT support team during request fulfillment.

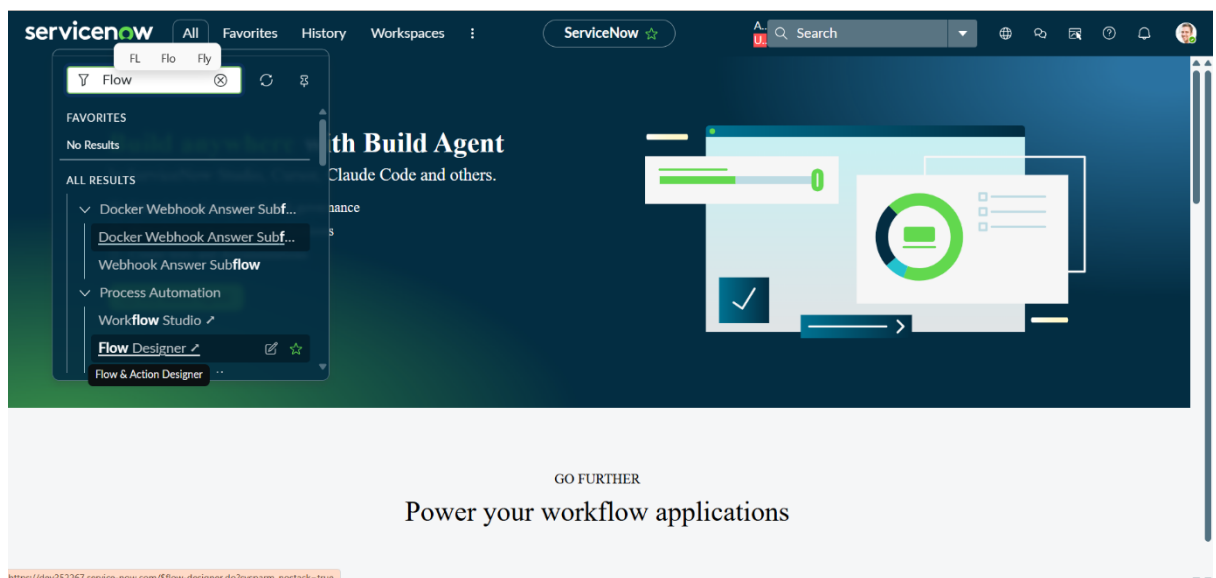

6.3 Flow Designer Implementation

Flow Designer is a low-code automation tool in ServiceNow that is used to automate business processes without extensive scripting. In this project, Flow Designer automates the complete laptop request lifecycle, from request submission to completion.

When an employee submits a Laptop Request through the Service Catalog, the flow is automatically triggered. The workflow sends the request for approval, creates a Catalog Task for the IT support team if the request is approved, waits until the task is completed, and finally sends an email notification to the requester confirming that the laptop request has been fulfilled.

Steps to Create the Flow

1. Open ServiceNow Studio.
2. Select the project application.
3. Open Flow Designer.
4. Click New and create a new flow.
5. Enter the flow name as Laptop Request Flow.
6. Configure the trigger as Catalog Item Requested and select the Laptop Request catalog item.
7. Add the required flow actions:
 - Ask for Approval
 - If (Approval Decision)
 - Create Catalog Task
 - Wait for Condition
 - Send Email
8. Save, test, and activate the flow.

The screenshot displays the Workflow Studio interface. The top navigation bar includes 'Workflow Studio', 'Homepage', 'Operations', and 'Integrations'. Below this, a tabbed interface shows 'Playbooks', 'Flows' (selected), 'Subflows', 'Triggers', 'Actions', and 'Decision tables'. A 'New' dropdown menu is open, showing options: Playbook, Flow (highlighted), Subflow, Trigger, Action, Decision table, and Help me decide.

The 'Flows' section shows a list of 95 flows. The table below lists several flows:

Name	Application	Status	Active	Updated
Application Intake Request Flow (Deprecated)	Application Intake	Published	false	2026-04-21 20:07:22
Application Intake Request V2	Application Intake	Published	true	2026-04-21 20:07:22
Benchmark Recommendation Evaluator	Benchmarks Spoke	Published	true	2026-02-02 20:07:22
Business process approval flow	Global	Published	true	2020-09-27 22:06:13
Category Automation	Global	Draft	true	2026-05-12 02:15:55
category flow	Global	Published	true	2026-05-12 06:17:36
Change - Cloud Infrastructure - Authorize	Global	Published	true	2020-11-11 07:08:05
Change - Conflict Detection	Global	Published	true	2026-02-02 19:59:23
Change - Emergency - Authorize	Global	Published	true	2020-10-06 05:39:49

On the right, there are sections for 'Pick up where you left off' (listing Metro Project, Student Attendance Status, and category flow) and 'Latest updates' (listing System Administrator modifications).

The bottom section shows the 'New Flow' configuration form. The flow name is 'Laptop Request Flow', the application is 'Global', and the description is 'flow for laptop request'. A 'Show additional properties' link is available. At the bottom right, there are 'Cancel' and 'Build flow' buttons.

6.4 Flow Trigger Configuration

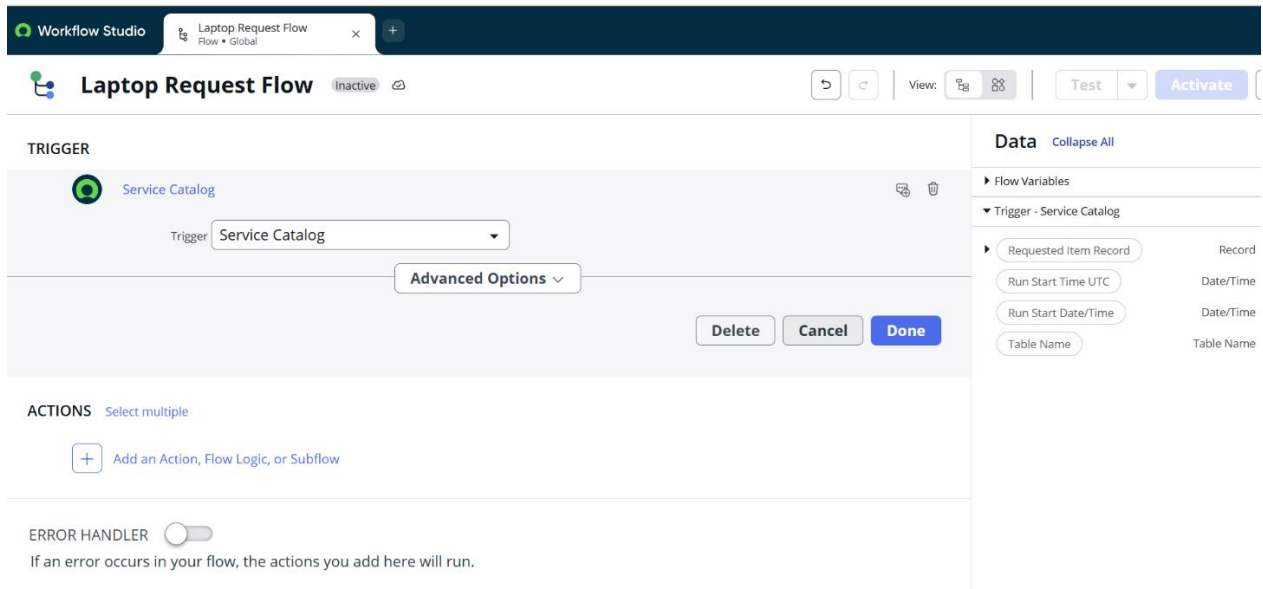

The **Flow Trigger** is the starting point of the workflow. In this project, the trigger is configured to automatically start the flow whenever an employee submits the **Laptop Request** catalog item through the Service Catalog. This ensures that every submitted request is processed without any manual intervention.

Steps to Configure the Flow Trigger

1. Open **Flow Designer**.
2. Open the **Laptop Request Flow**.
3. Click **Trigger**.
4. Select **Service Catalog** as the trigger type.
5. Choose **Catalog Item Requested** as the trigger.
6. Select the **Laptop Request** catalog item.
7. Save the trigger configuration.

Purpose of the Flow Trigger

The Flow Trigger automatically initiates the workflow when a laptop request is submitted. It eliminates the need for manual execution, ensuring that every request enters the approval and fulfillment process immediately after submission.

6.5 Ask for Approval Configuration

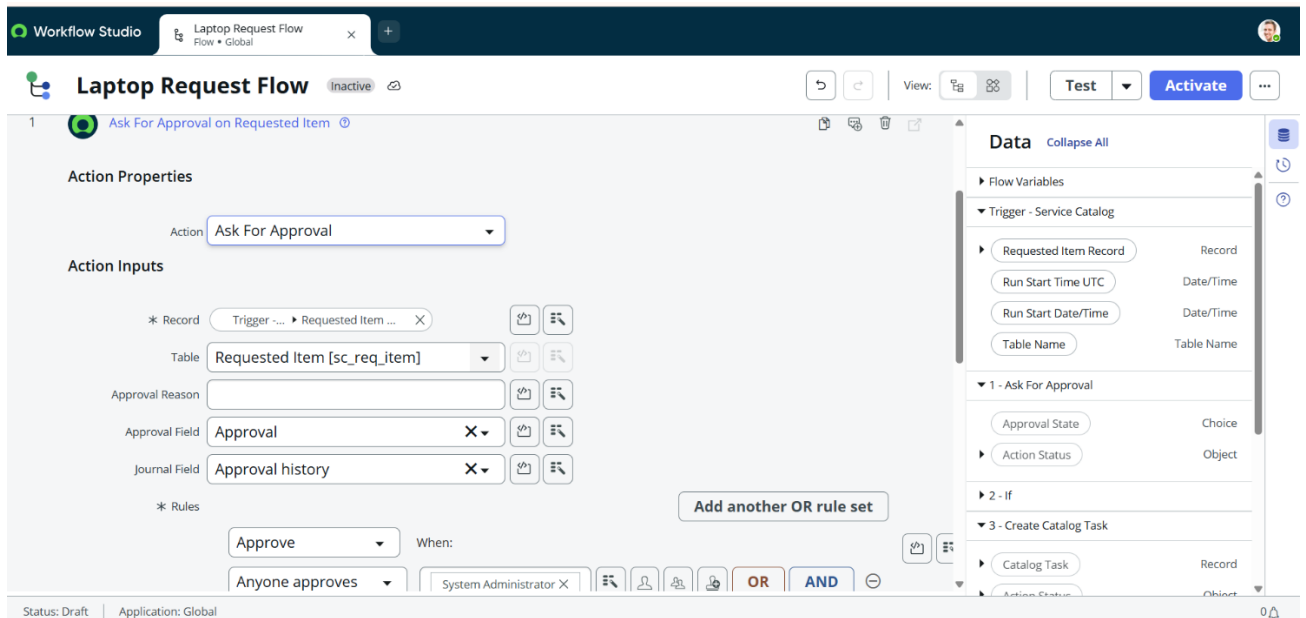

The Ask for Approval action is used to obtain approval before processing the laptop request. When a user submits a laptop request, the workflow automatically sends an approval request to the designated approver. The workflow proceeds only after the approval decision is made.

Steps to Configure Ask for Approval

1. Open Flow Designer.
2. Open the Laptop Request Flow.
3. Click the + icon to add a new action.
4. Search for and select Ask for Approval.
5. Select the Request Item as the record.
6. Configure the approver (User or Group).
7. Set the approval rule to Anyone Approves.
8. Save the action and continue building the workflow.

Purpose of Ask for Approval

The Ask for Approval action ensures that every laptop request is reviewed and authorized before it is processed. This helps maintain organizational policies, prevents unauthorized laptop allocation, and ensures that only approved requests proceed to the IT fulfillment stage.

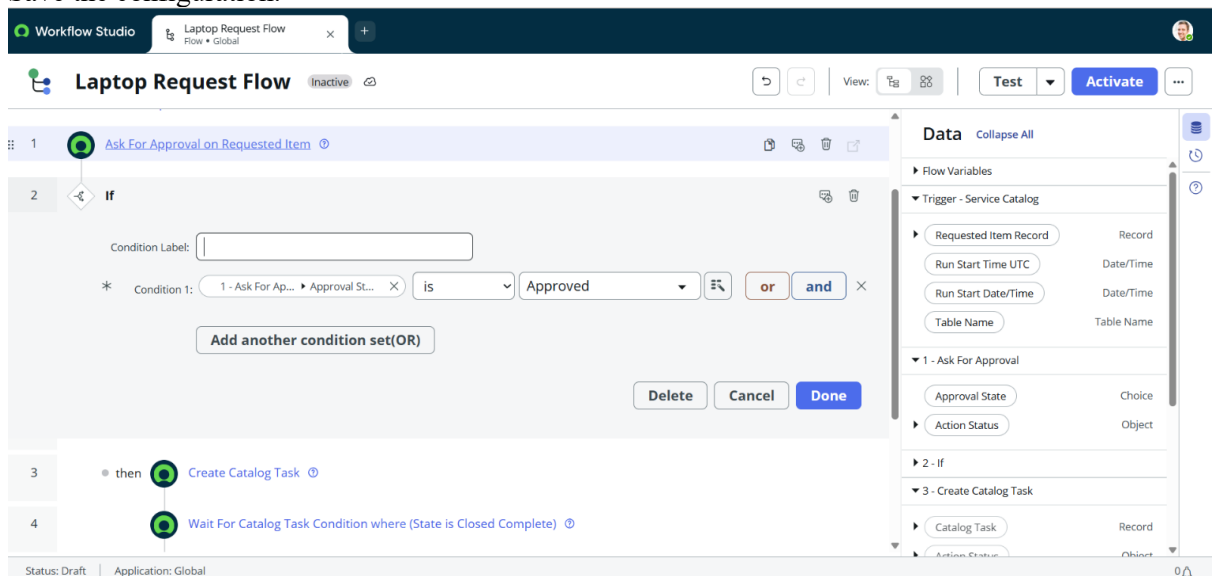

6.6 Approval Decision (If Condition)

The **If Condition** is used to evaluate the approval result. Based on the approver's decision, the workflow determines whether to continue processing the laptop request or stop the flow.

If the request is **approved**, the workflow proceeds to create a **Catalog Task** for the IT support team. If the request is **rejected**, the workflow ends without creating any task.

Steps to Configure the If Condition

1. Open **Flow Designer**.
2. Open the **Laptop Request Flow**.
3. Click the + icon below the **Ask for Approval** action.
4. Select **Flow Logic** → **If**.
5. Configure the condition to check the **Approval State**.
6. Set the condition to **Approval State is Approved**.
7. Save the configuration.

6.7 Catalog Task Creation

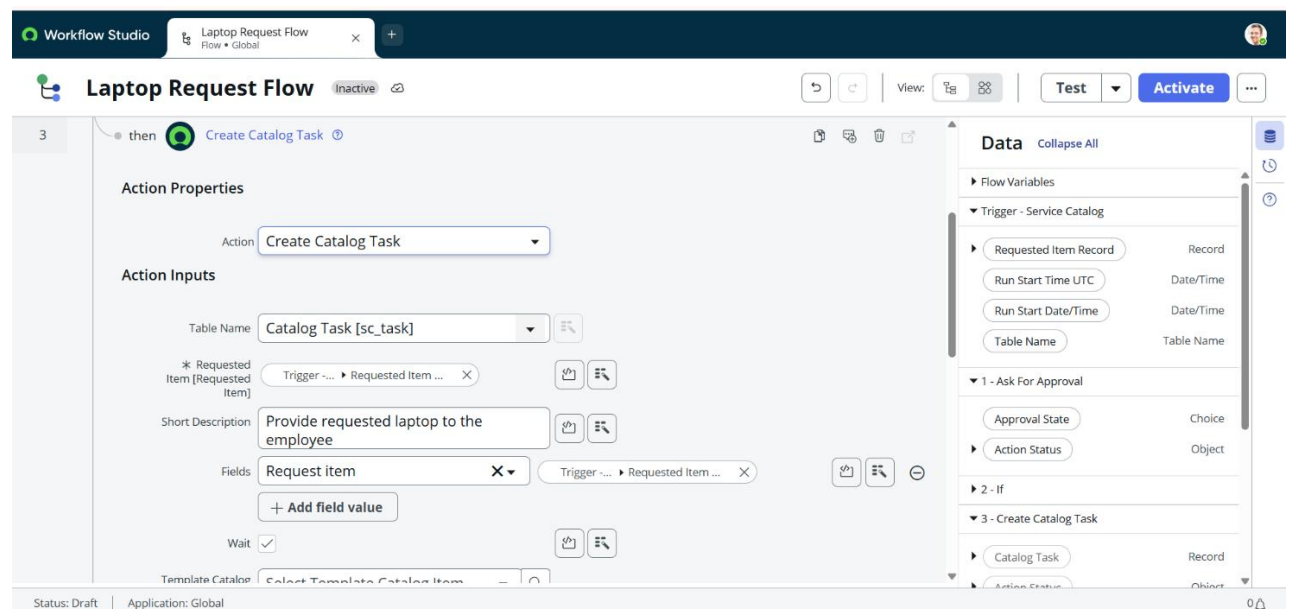

The **Create Catalog Task** action is used to automatically generate a task for the IT support team after a laptop request has been approved. This task contains the necessary information required to process and fulfill the laptop request.

Steps to Configure the Create Catalog Task Action

1. Open **Flow Designer**.
2. Open the **Laptop Request Flow**.
3. In the **True** branch of the **If Condition**, click the + icon.
4. Search for and select **Create Catalog Task**.
5. Select the **Request Item** as the associated record.
6. Enter a suitable **Short Description** (e.g., *Provide the requested laptop to the employee*).
7. Save the configuration.

Purpose of the Create Catalog Task

The **Create Catalog Task** action automatically assigns the laptop provisioning task to the IT support team after approval. This eliminates manual task creation, improves efficiency, and ensures that every approved laptop request is processed in a consistent and timely manner.

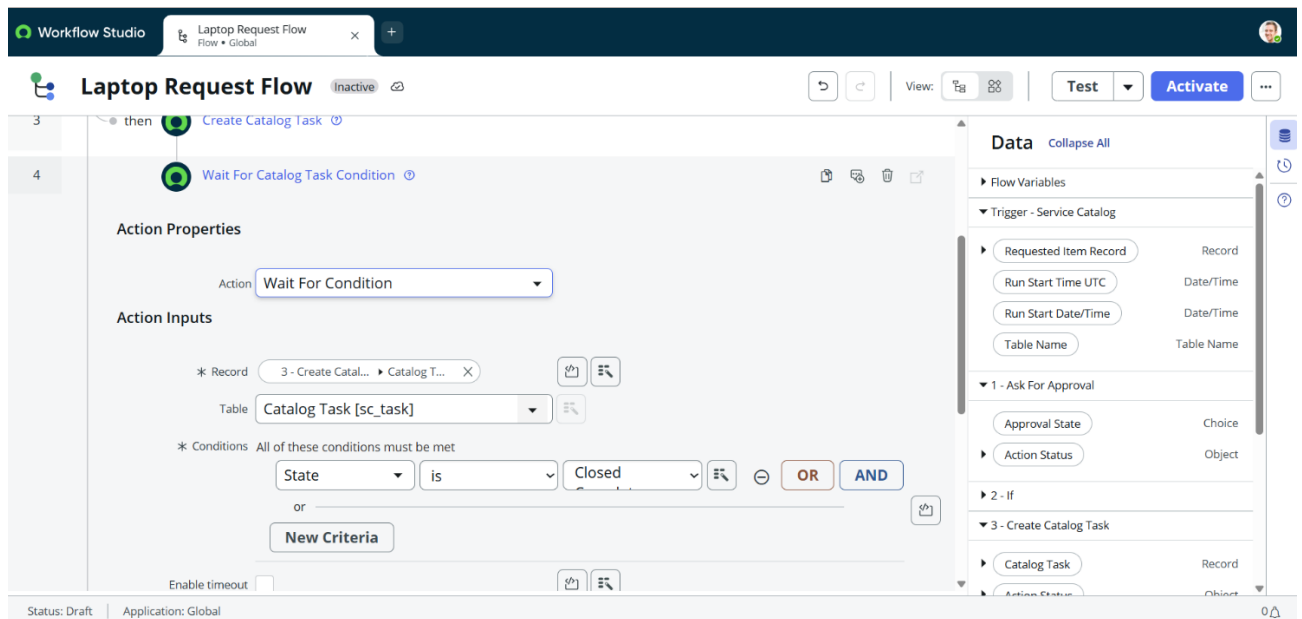

6.8 Wait for Condition Configuration

The **Wait for Condition** action is used to pause the workflow until the **Catalog Task** is completed by the IT support team. Once the task is marked as **Closed Complete**, the workflow automatically resumes and proceeds to the next step.

Steps to Configure Wait for Condition

1. Open **Flow Designer**.
2. Open the **Laptop Request Flow**.
3. Click the + icon below the **Create Catalog Task** action.

4. Search for and select **Wait for Condition**.
5. Select the **Catalog Task** record.
6. Configure the condition as **State is Closed Complete**.
7. Save the configuration.

6.9 Email Notification Configuration

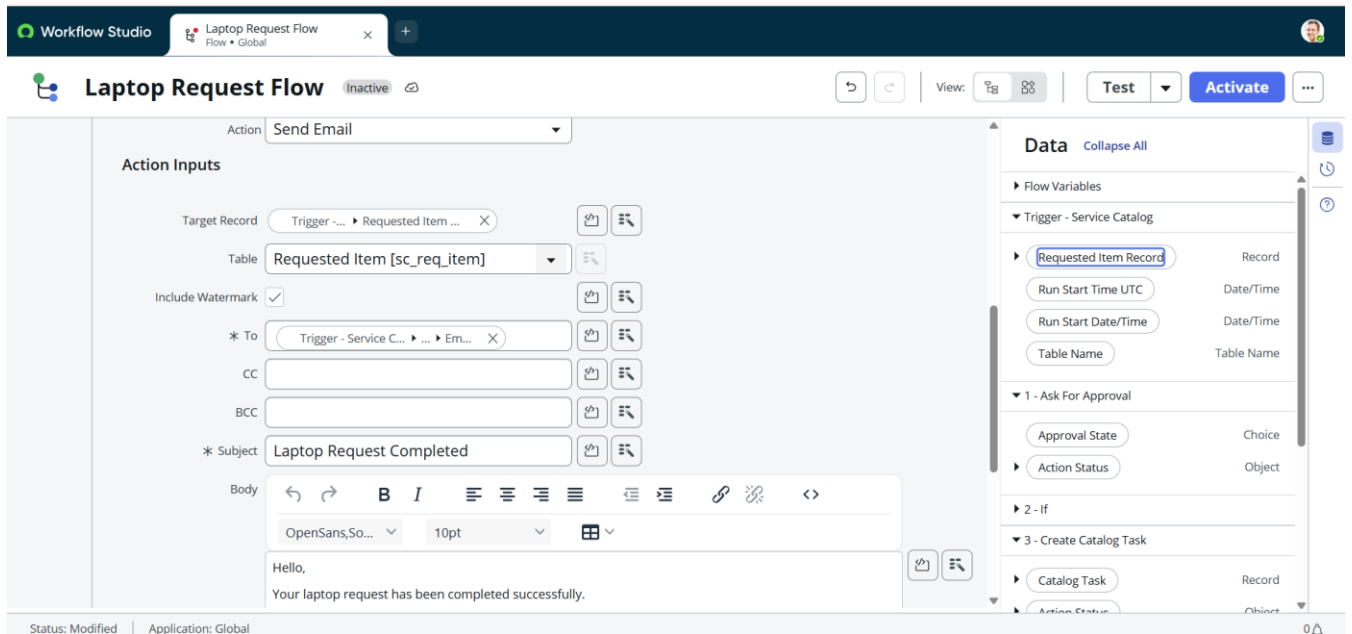

The Send Email action is used to automatically notify the employee after the laptop request has been successfully completed. Once the Catalog Task is marked as Closed Complete, the workflow sends an email confirming that the requested laptop has been provided.

Steps to Configure the Send Email Action

1. Open **Flow Designer**.
2. Open the **Laptop Request Flow**.
3. Click the + icon below the **Wait for Condition** action.
4. Search for and select **Send Email**.
5. Configure the recipient using the **Requested For** user (or the appropriate requester field).
6. Enter the email **Subject** and **Body** with the laptop request completion details.
7. Save the configuration.

Purpose of the Send Email Action

The Send Email action automatically informs the employee that the laptop request has been completed. This improves communication, keeps users updated on the status of their requests, and enhances the overall user experience by eliminating the need for manual notifications.

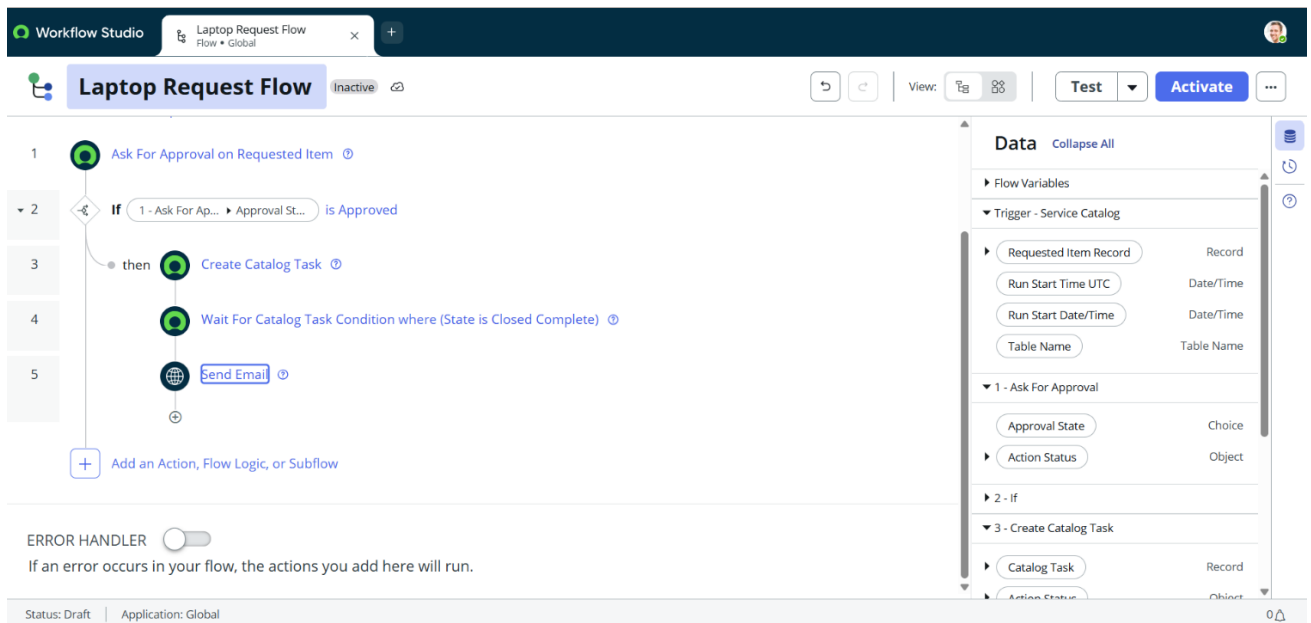

6.10 Workflow Summary

The **Laptop Request Flow** automates the complete laptop request process using **Flow Designer**. When an employee submits a laptop request through the **Service Catalog**, the workflow is triggered automatically. The request is sent for approval, and if approved, a **Catalog Task** is created for the IT support team. The workflow then waits until the task is completed and finally sends an email notification to the requester confirming that the laptop request has been fulfilled.

This automated workflow reduces manual effort, ensures consistent request processing, improves transparency, and enhances the overall efficiency of the laptop request management process.

Workflow Sequence

1. Employee submits a **Laptop Request** through the Service Catalog.
2. The **Flow Trigger** starts the workflow automatically.
3. The request is sent for **Approval**.
4. The **If Condition** checks whether the request is approved.
5. If approved, a **Catalog Task** is created for the IT support team.
6. The workflow waits until the Catalog Task is marked as **Closed Complete**.
7. An **Email Notification** is sent to the requester.
8. The workflow ends successfully.

7. Screenshots of Output

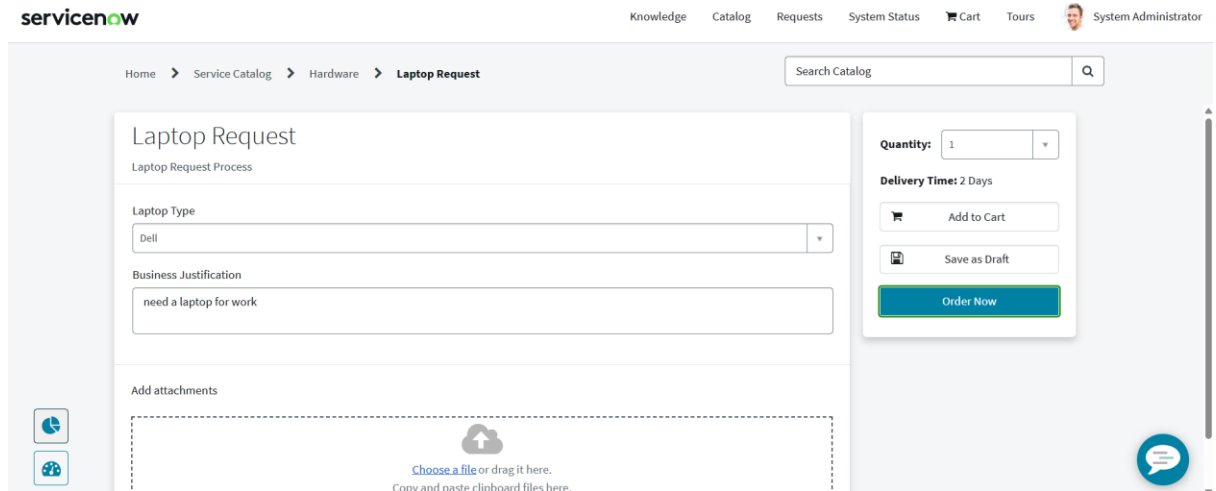

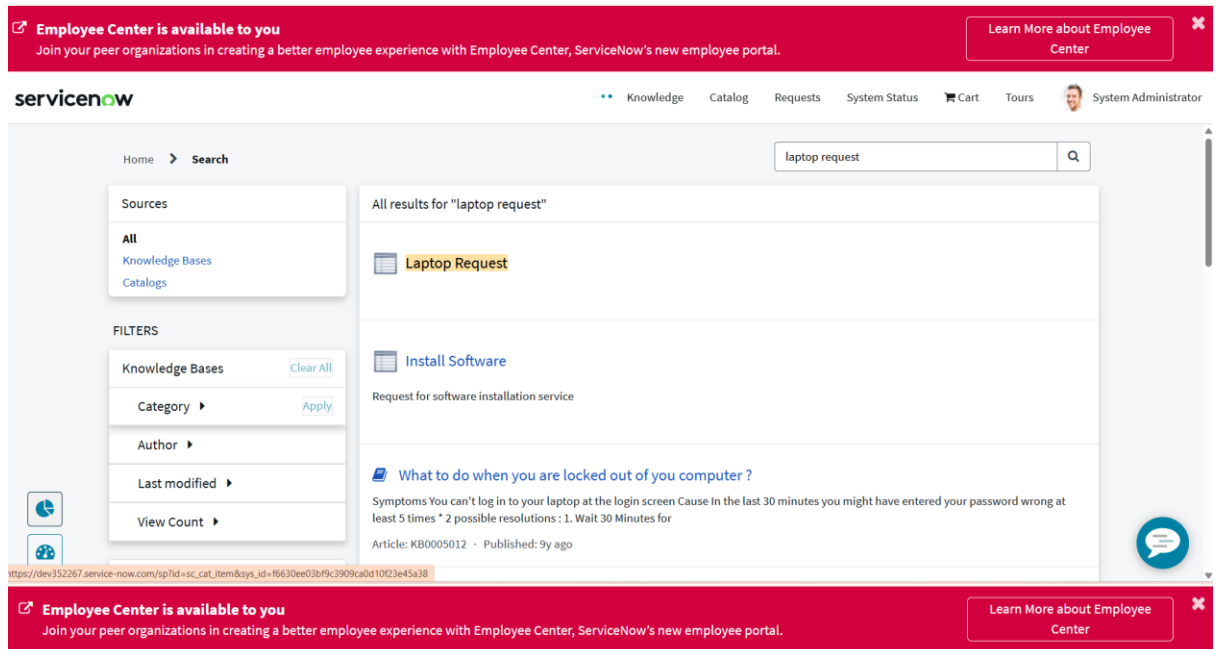

7.1 Laptop Request Catalog Item

This screenshot shows the **Laptop Request** catalog item created in the **Service Catalog**. It serves as the entry point for employees to submit laptop requests.

7.2 Laptop Request Form

This screenshot displays the request form containing the configured catalog variables, including **Laptop Type** and **Business Justification**.

7.3 Flow Designer

This screenshot shows the complete **Laptop Request Flow** designed using **Flow Designer**.

7.4 Requested Item

This screen shows the Requested Item (RITM) created after the Laptop Request is submitted. The Approval field indicates that the request has been successfully approved.

The screenshot shows the 'Requested Items View: Self Service' table in ServiceNow. The table lists various requested items with columns for Number, Catalog, Item, Approval, Quantity, and Stage. The first seven rows show 'Laptop Request' items, all with 'Approved' status. The last three rows show 'Standard Laptop' and 'Samsung Galaxy S7' items, all with 'Requested' status. The table is filtered by 'Request Requested for = System Administrator' and 'Active = true'. The bottom of the table shows '1 to 13 of 13' items.

Number	Catalog	Item	Approval	Quantity	Stage
RITM0010009	(empty)	Laptop Request	Approved	1	1
RITM0010008	(empty)	Laptop Request	Approved	1	1

4 Wait For Condition	Core Action	Completed	2026-06-27 09:17:29 48ms
5 Send Email		Completed	2026-06-27 09:17:29 14981ms

7.7 Email Notification

This screenshot shows the email notification sent to the requester after the Catalog Task is completed.

8. Conclusion

The **Laptop Request Process** developed using the ServiceNow platform successfully automates the complete lifecycle of a laptop request. The system enables employees to submit requests through the Service Catalog, automates the approval process, creates Catalog Tasks for the IT support team, monitors task completion, and sends email notifications upon successful fulfillment.

By using Flow Designer, the project reduces manual effort, improves transparency, and ensures consistent request processing. The automated workflow enhances operational efficiency, minimizes processing time, and provides a scalable solution that can be extended to support additional IT service requests in the future.
