Roll Number	23A51A0526
Project Name	Laptop Request Process
Maximum Marks	

Project Planning

The Laptop Request Process project was planned to simplify and automate employee laptop requests for official use. The planning phase included:

1. **Requirement Gathering:** Identified the need for employees to request laptops through a standardized, self-service method instead of manual emails.
2. **Workflow Design:** Designed an end-to-end workflow: request submission → manager approval → IT fulfillment → notification.
3. **Service Catalog Setup:** Planned a new catalog item "Laptop Request Process" with required variables: Laptop Type – to capture hardware specification needs, Business Justification – to validate official use.
4. **Automation Design:** Planned Flow Designer workflow to automate manager approval routing and post-approval task creation for IT teams.
5. **Notification Strategy:** Defined automated email notifications to keep requesters informed at submission, approval/rejection, and completion stages.
6. **Testing & Validation:** Planned testing of the full lifecycle to ensure accurate approvals, task generation, and status tracking before go-live.

Project Logic

The project follows a streamlined automated workflow:

1. **Request Submission:** Employee submits a "Laptop Request" via the ServiceNow Service Catalog, selecting laptop type and entering business justification.
2. **Record Creation & Validation:** System creates a request record and validates all required fields are completed.
3. **Approval Workflow Trigger:** Flow Designer automatically triggers and routes the request to the employee's manager for approval.
4. **Approval Decision:** Manager reviews and approves or rejects the request directly in ServiceNow or via email. If Rejected: Request is closed and requester is notified with reason. If Approved: Workflow proceeds to fulfillment.
5. **Task Generation:** Upon approval, a catalog task is auto-generated and assigned to the IT fulfillment team for laptop provisioning.
6. **Fulfillment & Closure:** IT team processes the task, updates status, and closes it once the laptop is issued.
7. **Notifications:** Automated emails notify the requester at each key stage: submission received, approval status, and fulfillment completed.

This logic ensures faster processing, manager accountability, reduced manual effort, and full transparency for employees and IT.
